

Teaching Statement

My teaching philosophy is built on the conviction that mastering strategy, innovation, and digital transformation requires a seamless integration of theoretical knowledge and practical application. Therefore, I strive to create learning experiences that blend theoretical and experiential learning. In line with the core principles of the University of Zurich, all my courses are anchored in research-based teaching. As an active researcher, I bring the up-to-date insights from the academic community directly into the lecture hall, using my own published work and contemporary journal discussions to train students in critical, analytical thinking. To complement this theoretical foundation, I utilize case- or problem-based and action learning to develop the tacit knowledge necessary to navigate complex business environments.

In a typical course, I gradually shift the responsibility from the instructor to the students over the course of the semester, creating an environment where students step out of their comfort zones through live case studies, discussions and innovation challenges with corporate partners. To bridge academic rigor with business insights, I frequently integrate industry experts and corporate partners into my courses via guest workshops and collaborative project coaching, preparing students to solve real-world strategic problems. For example, I am currently developing a case study about the GenAI adoption journey of Denmark's largest bank which I have taught in collaboration with a senior executive. I also systematically experiment with emerging technologies to enhance the student learning journey, e.g., by employing GenAI tools to produce interactive learning media. In the era of widespread GenAI availability, traditional evaluative formats are increasingly challenged. Thus, I strive to design activity-based assessments that measure high-level synthesis and problem-solving abilities. Notably my courses have been among first at CBS to pioneer active-participation assessments.

Over the past 10+ years of teaching as a faculty member at Copenhagen Business School and previously at WU Vienna, I have developed a comprehensive portfolio of teaching, as well as course coordination and design on the Bachelor-, Master-, PhD-, and MBA-Level. I have designed and delivered over 42 courses spanning 11 distinct course formats, consistently receiving excellent qualitative and quantitative evaluations from students and faculty peers (see below). Furthermore, I actively participate in the continued educational portfolio development of my university. As a member of the development team for a new program on "AI in Business" I am co-developing a new Master program at the intersection of business and technology. Here I am responsible for the course "Strategy and AI", that centers on the changing nature of firm strategy in the age of AI, as well as "AI Venture Lab" that focuses on the development of new innovations and entrepreneurial ideas with AI as a collaboration partner and is organized in close collaboration with the Copenhagen School of Entrepreneurship.

This diverse pedagogical foundation equips me well to contribute to the UZH community across a wide-range of academic roles, course formats, and program responsibilities. I am particularly eager to help shape the future of business education in the age of AI. By integrating advanced

technological tools with robust, research-led frameworks, I aim to lead initiatives that redefine how we teach, assess, and prepare the next generation of strategic thinkers to thrive in an increasingly automated corporate landscape.

Teaching experience and evaluations at Copenhagen Business School:

(instructor ratings from 1 to 5, 5 = best)

Course	Level	Role	ECTS	Year	Evaluation
Project Management and Product Development	Master	Instructor	7.5	2025	4.4
